EDUCATION

Bachelor of Computer Science

University of Central Florida

Sep 2016 - May 2020

Orlando, FL

Bachelor of Computer Science (Semester Abroad)

Hong Kong Polytechnic University

Jan 2019 - May 2019

Hong Kong

SKILLS

Programming Languages Typescript | Javascript | Java | C# | PHP | HTML/CSS | HandlebarsJS | GraphQL
Technologies AWS | GCP | Pub/Sub | Docker | ReactJS | Symfony | NestJS | NodeJS | Flutter | Android
Tools Git | GitHub | BASH | Azure | MongoDB | MySQL | PostgreSQL

EXPERIENCE

Keller Williams Realty Inc.

Software Engineer

Sep 2022 - Mar 2026

Remote

- Developed large portions of www.kw.com. A mixed-approach front-end solution utilizing Flutter and a monolithic HandlebarsJS and Java solution (Brightspot CMS tool).
- Created a wrapping service around the Java API, which came from the aforementioned CMS solution, in NestJS and Typescript. This layer was intended to assist in replacing the underlying CMS solution in the future after more development.
- Reduced data delays for a majority of our used data from 15 min in production data to near-instant. Instead of waiting for a cron job that would replicate data we instead had data sent immediately when changes occurred from a separate DB using an existing cloud function.
- Coached QA members to help them learn how to write automation code. Instructed them on how to use IntelliJ with Selenium, Cucumber and Java with Gherkin Syntax.
- Drafted ProtoBuf models to standardize PubSub messaging and prevent implications in communicated data as well as reduce errors. These models were never adopted which caused numerous cross-org issues as both teams never clearly identified expected data sent and received.
- Utilized GitHub Copilot in VSCode IDE to assist in code writing. The limits of this were mainly to prevent repetitive typing (i.e. Adding null coalesces to a series of fields which were nullable, copying methods or fields from one section of a class to another)
- Developed and executed QA/QAT/Prod scripts which modified, created, or retrieved data in our CMS solution. These scripts were written in Java and executed on their respective environments. We would test and review these scripts among the team locally using Docker with several containers to replicate a QA environment.

I-CON Systems, LLC.

Full Stack Developer

Nov 2021 - Sep 2022

Orlando, FL (Hybrid)

- Developed an internal fixture assembly assistant application. Aided in streamlining device assembly by breaking down system into steps which required validation before entering the next step.
- Developed water fixture management application on a Blazor, ReactiveUI FE with FluentValidation, Moq and Xunit for unit and integration tests. C#/.NET with small bits of JSInterop for backend logic.
- Water fixture management application was hosted using Azure.

Gravitational Marketing

Full Stack Developer

Oct 2020 - Nov 2021

Remote

- Developed Call Commando 2.0, a lead management application, a CRM application designed to improve lead interactions and profitability. This was done primarily by identifying and serving leads on a set cadence which could be modified based on an agent's interactions with that lead.
- Updated WordPress sites, which were our primary lead generation tool.

NOTABLE PROJECTS

Doc Foxx

Full Stack Developer - <https://www.docfoxx.com>

March 2026 - Current

Plant City, FL

- Designed, developed, and deployed a site for Doc Foxx (a Christian organization).
- Hosted on AWS via EC2, S3, and Cloudfront. AWS SES for contact emails. Route53 for easier DNS and subdomain management. Provisioned credentials for services through IAM.
- Utilized React, Typescript and Vite to build and deploy FE code. NestJS and Typescript to deploy backend with pm2 and Nginx on EC2 instance for scalability and future flexibility based on current road map.
